

CBD Mooncream FAQs

What is CBD anyway?

Cannabidiol (CBD) is one of more than a hundred phytocannabinoids, or naturally occurring compounds, found in cannabis (marijuana). Unlike the more well-known cannabinoid THC, CBD does not produce a high.

How does it work?

Both THC and CBD act on a system of receptors in your body called cannabinoid receptors, which are found throughout the body (including the skin). These receptors are associated with pain sensation, appetite, immune function, mood and more. Cannabinoids like CBD are similar enough to compounds that your body naturally makes, called endocannabinoids, that they can interact with the endocannabinoid system present in the human body.

What does it do?

Topically applied CBD can help address pain or inflammation when applied to a specific area. Unlike many other topical pain relief products (which may just mask pain with menthol or camphor), CBD can actually make pain go away for a certain time period.

What else is in CBD Mooncream?

Other key ingredients include:

Aloe -- skin healing properties

Kukui seed -- a natural antioxidant that's great for the skin

Arnica -- a natural anti-inflammatory good for muscle and joint pain

Vitamin E -- anti-inflammatory that's great for skin

Lavender -- great for relaxation

If you'd like to see a more complete ingredients list, feel free to ask us!

Can I use it at home?

Yes! CBD Mooncream is a great alternative for pain relief if you are unable to receive a massage for some reason (although it is particularly amazing when combined with massage). Our calming formula is also great for use as a daily moisturizer.

Does CBD Mooncream have psychoactive effects?

By definition, CBD products contain no more than a 0.3% concentration of THC, so CBD Mooncream will not cause a high feeling.
